# Russia Compliance

API Guide for Synchronous, Asynchronous, and  
REST Messages

# Table of Contents

|                                                            |           |
|------------------------------------------------------------|-----------|
| <b>Russia Compliance</b>                                   | <b>1</b>  |
| API Guide for Synchronous, Asynchronous, and REST Messages | 1         |
| <b>Get started</b>                                         | <b>18</b> |
| Intro to asynchronous messages                             | 19        |
| Message Type and Info Exchange display name                | 21        |
| Error messages                                             | 21        |
| Where are errors found in the UI?                          | 21        |
| What do the errors look like and how are they interpreted? | 23        |
| What are the different error types?                        | 25        |
| Map In Failed - Class 1 Errors                             | 25        |
| Processing Failed - Class 2 Errors                         | 25        |
| Map Out Failed                                             | 25        |
| Blocked                                                    | 25        |
| Needs Investigation                                        | 25        |
| What are the different error classes?                      | 26        |
| Class 1 Errors                                             | 26        |
| Class 2 Errors                                             | 26        |
| Class 3 Errors                                             | 26        |
| Intro to SOAP messages                                     | 27        |
| Authentication                                             | 27        |
| App-specific authentication                                | 28        |
| WSDL access                                                | 28        |
| SOAP API call limits                                       | 29        |

|                                                |           |
|------------------------------------------------|-----------|
| Intro to REST messages .....                   | 30        |
| <b>HTTP response status codes</b> .....        | <b>30</b> |
| Successful response .....                      | 30        |
| Redirect message .....                         | 30        |
| Client error status codes .....                | 30        |
| Server error status codes .....                | 31        |
| How to use this guide .....                    | 32        |
| <b>Read the guidelines table</b> .....         | <b>32</b> |
| <b>MDLP credential management</b> .....        | <b>33</b> |
| MDLP credential management APIs .....          | 35        |
| <b>Digital Certificate Upload (REST)</b> ..... | <b>35</b> |
| Digital Certificate Upload request .....       | 35        |
| Authentication .....                           | 35        |
| Guidelines .....                               | 36        |
| Example .....                                  | 36        |
| Errors .....                                   | 36        |
| Digital Certificate Upload response .....      | 36        |
| Guidelines .....                               | 36        |
| Example - Success .....                        | 37        |
| Example - Failure .....                        | 37        |
| <b>Report retrieval APIs</b> .....             | <b>37</b> |
| Tokens .....                                   | 37        |
| Authentication .....                           | 37        |
| Request guidelines .....                       | 38        |
| Request examples .....                         | 38        |
| Response guidelines .....                      | 38        |
| Response example .....                         | 39        |

|                                  |    |
|----------------------------------|----|
| <i>Errors</i> .....              | 40 |
| Tasks .....                      | 40 |
| <i>Authorization</i> .....       | 40 |

## **Serial number and crypto code management** ..... 46

### **Crypto code and serialization APIs** ..... 48

#### **Serial Number Exchange Request & Response (XML)** ..... 48

|                                       |    |
|---------------------------------------|----|
| Serial Number Exchange Request .....  | 48 |
| <i>Guidelines</i> .....               | 48 |
| <i>Example</i> .....                  | 51 |
| <i>Errors</i> .....                   | 52 |
| Serial Number Exchange Response ..... | 52 |
| <i>Guidelines</i> .....               | 53 |
| <i>Example</i> .....                  | 58 |
| <i>Errors</i> .....                   | 59 |

#### **Serial Number Exchange Request & Response (SAP ATTP)** ..... 60

|                                      |    |
|--------------------------------------|----|
| Serial Number Exchange Request ..... | 60 |
| <i>Guidelines</i> .....              | 60 |

|                                                                        |           |
|------------------------------------------------------------------------|-----------|
| <i>Example</i> .....                                                   | 61        |
| <i>Errors</i> .....                                                    | 62        |
| Serial Number Exchange Response .....                                  | 62        |
| <i>Guidelines</i> .....                                                | 62        |
| <i>Example</i> .....                                                   | 64        |
| <i>Errors</i> .....                                                    | 66        |
| <b>Serial Number Request &amp; Response (SOAP)</b> .....               | <b>67</b> |
| Serial Number Request .....                                            | 67        |
| <i>Guidelines</i> .....                                                | 67        |
| <i>Example</i> .....                                                   | 69        |
| <i>Errors</i> .....                                                    | 70        |
| Serial Number Response .....                                           | 71        |
| <i>Guidelines</i> .....                                                | 71        |
| <i>Example</i> .....                                                   | 74        |
| <b>Serial Number Manager Request and Response (Verify Brand)</b> ..... | <b>75</b> |
| Serial Number Manager Request .....                                    | 75        |
| <i>Guidelines</i> .....                                                | 75        |
| <i>Example</i> .....                                                   | 77        |
| <i>Errors</i> .....                                                    | 78        |
| Serial Number Manager Response .....                                   | 79        |
| <i>Guidelines</i> .....                                                | 79        |
| <i>Example</i> .....                                                   | 83        |
| <i>Errors</i> .....                                                    | 84        |
| Remove crypto codes APIs .....                                         | 87        |
| <b>Remove Crypto Codes (SOAP)</b> .....                                | <b>87</b> |
| Remove Crypto Codes Request .....                                      | 87        |
| <i>Guidelines</i> .....                                                | 87        |
| <i>Example</i> .....                                                   | 88        |

|                                                            |            |
|------------------------------------------------------------|------------|
| <i>Errors</i> .....                                        | 89         |
| Remove Crypto Codes Response .....                         | 89         |
| <i>Guidelines</i> .....                                    | 89         |
| <i>Example</i> .....                                       | 90         |
| <b>Fetch Remove Crypto Codes Result (SOAP)</b> .....       | <b>91</b>  |
| Fetch Remove Crypto Codes Result Request .....             | 91         |
| <i>Guidelines</i> .....                                    | 91         |
| <i>Example</i> .....                                       | 91         |
| <i>Errors</i> .....                                        | 92         |

# Get started

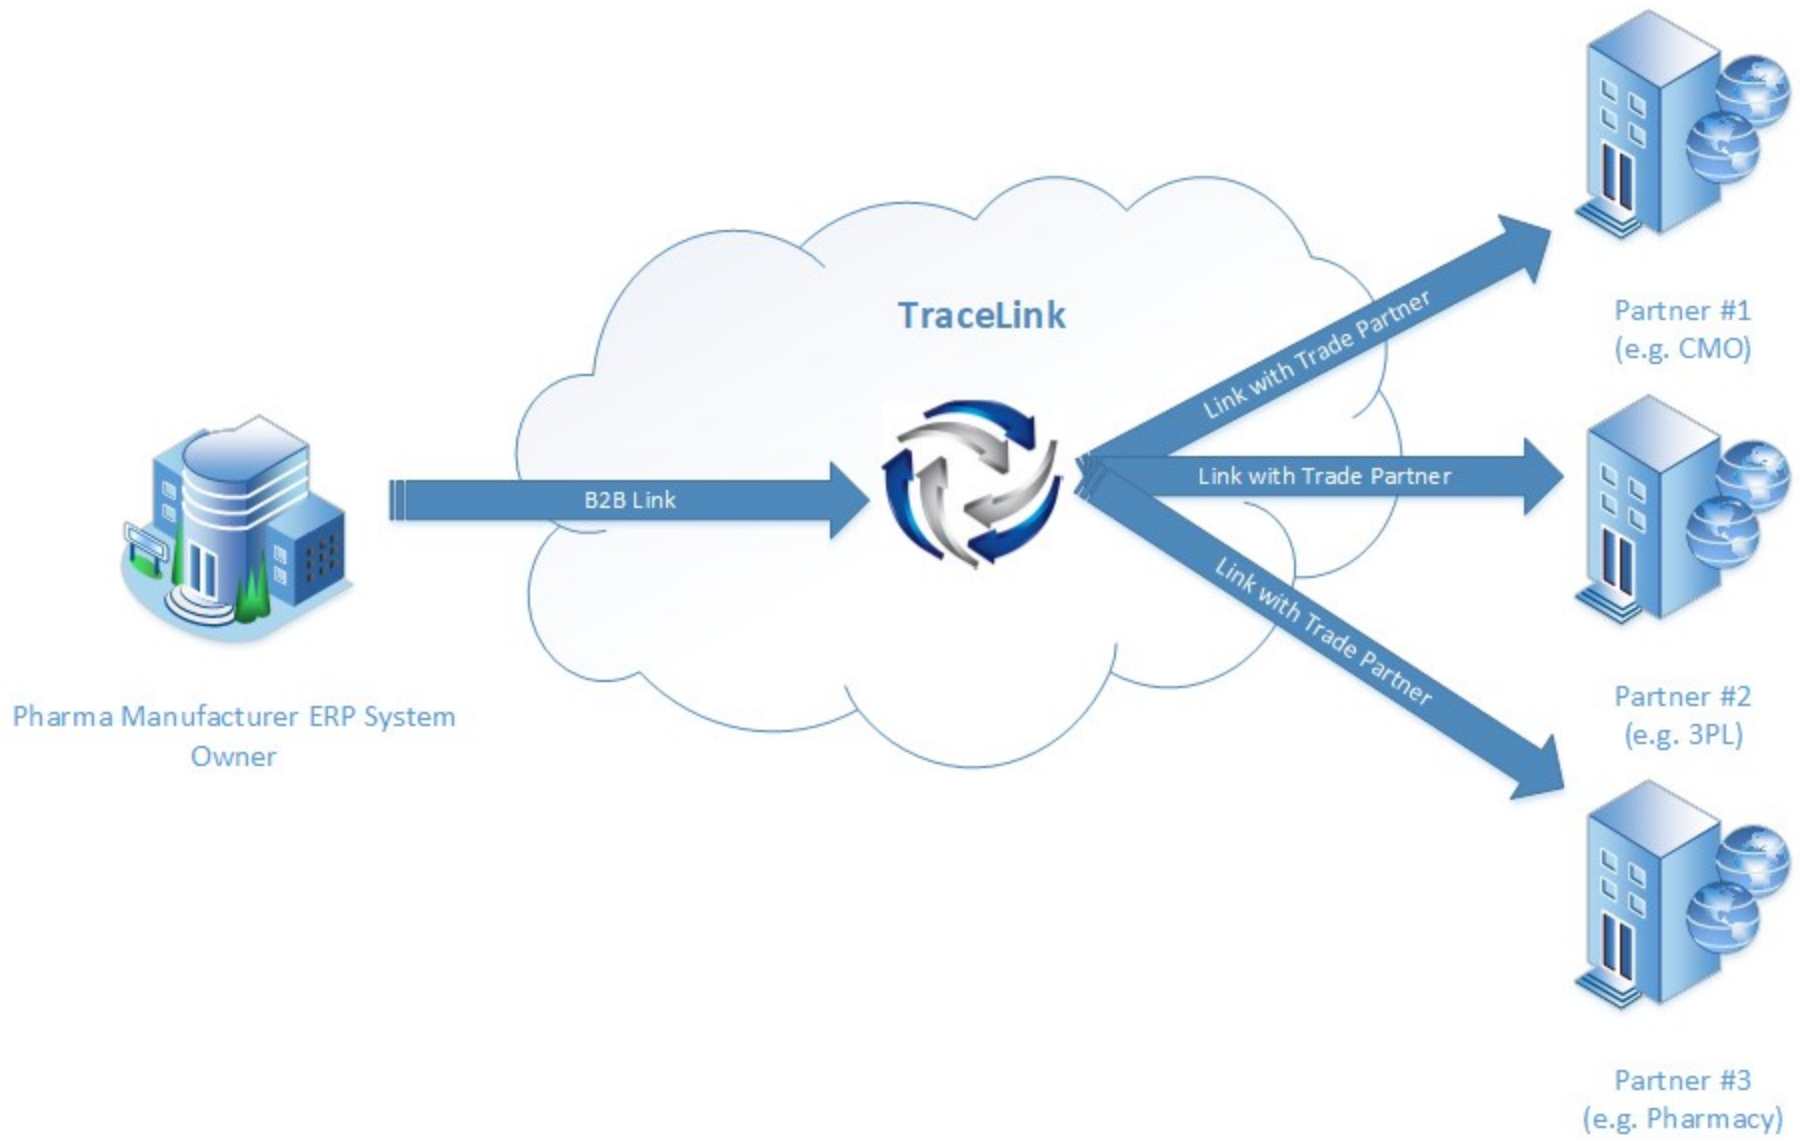

# Intro to asynchronous messages

TraceLink accepts a variety of file formats to ensure that messages between TraceLink Owners and their Partners are exchanged seamlessly. After integration is set up, when the Owner sends a message into TraceLink (targeted for a Partner) from their enterprise system, the message is sent in the Owner's preferred format. The message is translated (and stored) within TraceLink and is then reformatted into an outbound message for the Partner their preferred file format.

⚠ File size limit is 300mb for asynchronous messages sent inbound to TraceLink.

## Message Type and Info Exchange display name

The relevant Message Type (e.g. SOM\_DESTROY\_EVENT) and Info Exchange Display Name (e.g. Destroy Event) are included above each *Guidelines Table*. The Message Type is used when setting up B2B connections. Use the Info Exchange Display Name in Info Exchange to monitor and troubleshoot messages exchanged with Partners. See the *Info Exchange Online Help* for additional information.

How the Message Type is used depends on the type of B2B connection:

- AS2: The Message Type is in the AS2 header (e.g. SOM\_DESTROY\_EVENT).
- HTTP Post: The Message Type is part of the URL (e.g. [https://prodb2b.tracelink.com:5443/server?request=send&directory=inbox/SOM\\_DESTROY\\_EVENT&filename=<filename>](https://prodb2b.tracelink.com:5443/server?request=send&directory=inbox/SOM_DESTROY_EVENT&filename=<filename>)).
- SFTP: The Message Type is the folder in which the message is saved.

In Info Exchange Profiles, the Message Type is included in the "transaction" column of the Transactional Maps CSV file.

## Error messages

When configuring asynchronous messages, various errors may be encountered. These errors point to issues with message file validation, data configuration, duplicate files, adapter issues, authorization failures, or database look-up failures (such as look-ups for missing product master data attributes triggered by a look-up code in the file).

### Where are errors found in the UI?

Errors are found in the TraceLink UI in the *Info Exchange* app. Filter errors by error type under the *Processing Status* drop-down option. To display the actual error, select the hyperlinked error type associated with the designated message (see the image below for an example).

|                                                                                     | Date - Time            | Processing Code<br>Review Status | Output File Name | Output File Format | Actions |

## What do the errors look like and how are they interpreted?

❗ The example below reflects a "Map In" error type with errors identified in both the "Input" and "Output" (see *Scope*).

The following information is useful for interpreting errors:

1. The *Scope* (indicated in red below) identifies whether the error is in the input or output.
2. The error message is defined by the *Description* (indicated in yellow below). This provides some context as to why the error occurred. The *Detail* fields may also prove useful when troubleshooting errors in submitted data.
3. Depending on the type of error, the *InputAddress*, *OutputAddress*, *InterfacePath*, and/or *Value* information identifies the full path to the field and instance of that field that triggered the error to assist with troubleshooting.

The following error examples illustrate what an error may look like in the TraceLink application:

MapInput:

ERRORS

ID: Input\_Presentation\_Mismatch

Severity: Error

Category: Input\_Data\_Error

Description: Cannot parse input data according to the presentation.

Scope: Input

Detail[Input Path]: SNXDispositionAssignedMessage | MessageBody | choice\_1[0] | CommissionEvent | CommissionEventDetail[0] | EventDateTime

Detail[Input Data]: 2015-04621T08:18:00.140Z

Detail[Type]: DateTime - General Characters & XML Schema

Detail[Presentation]: YYYY-MM-DDThh:mm:ss[.sss][-hh:mm] - 2003-06-15T13:20:00.000-05:00

Detail[Error Name]: Presentation\_Mismatch

InputAddress

InterfacePath: SNXDispositionAssignedMessage | MessageBody | choice\_1[0] | CommissionEvent | CommissionEventDetail[0] | EventDateTime

XPath:

ParentElement: false

Value: /SNXDispositionAssignedMessage/MessageBody[1]/snx:CommissionEvent[1]/snx:CommissionEventDetail[1]/cmn:EventDateTime[1]/EventDateTime

OutputAddress

XPath:

ParentElement: false

Value: /can:CanonicalSNXDispositionAssignedEventType/can:MessageBody[1]/can:CommissionEvent[1]/can:CommissionEventDetail[1]/cmn:EventDateTime[1]

ID: Empty\_Tag\_Creation\_For\_Output\_Field

Severity: Error

Category: Output\_Data\_Error

Description: An empty tag was created for a target field, but an empty tag is not valid data for the field.

**Scope: Output**

Detail[Output Path]: CanonicalSNXDispositionAssignedEventType | MessageBody | choice\_1[\*] | CommissionEvent | CommissionEventDetail[\*] | EventDateTime

Detail[Minimum Target Iteration Count]: 1

Detail[Actual Iteration Count]: 0

OutputAddress

InterfacePath: 1

XPath:

ParentElement: false

Value: /can:CanonicalSNXDispositionAssignedEventType/can:MessageBody[1]/can:CommissionEvent[1]/can:CommissionEventDetail[1]/cmn:EventDateTime[1]

## What are the different error types?

The following provides a brief description of each TraceLink error type:

### Map In Failed - Class 1 Errors

This is the first step in the validation process as a file is received by TraceLink. This error is most often caused when required data is either missing or incorrect. This failure indicates that the file was poorly structured (e.g. data elements are in an incorrect order) or contained other errors that prevented TraceLink from integrating and processing the file. These instances trigger schema validation errors. In short, this error indicates that an inbound message has failed data translation. Map In Failed and Map Out Failed may also point to system errors in the map call.

An inbound message is designed to convert an external party's data format to Tracelink's format. The external party sends data to Tracelink for data transformation, therefore Tracelink is the recipient of the data.

### Processing Failed - Class 2 Errors

This is considered the second step in the validation process and generally where all of the business logic is found. This error indicates a failure at any point in a transformation document life cycle (e.g. transmission failure or back end code failure).

### Map Out Failed

This step is when TraceLink maps the outbound data, converting it into the receiving party's preferred format. Sometimes the rules can vary based on the file format. This error indicates an outbound message has failed at some point in this data conversion process. Map In Failed and Map Out Failed can also point to system errors in the map call.

### Blocked

A blocked error indicates a system blockage or processing failure.

### Needs Investigation

This error indicates a processing error or message data translation failure. This error type requires investigation to determine the root of failure. Often, this error occurs when the system believes it is receiving a duplicate file.

① TraceLink does have the ability to push these errors through manually.

## What are the different error classes?

There are three classes of errors that are pertinent to asynchronous integration:

### Class 1 Errors

Class 1 errors are mapping validation errors. These errors fall under the "Map In" error type. This is where the data structure of the message is validated (e.g. where data type information or an element's required or optional requirement is validated. Map In errors are returned if there is an issue with this first validation step. For example, if a required field is omitted, a class 1 error results.

### Class 2 Errors

Class 2 errors are data translation errors which can be found in the "Processing Failed" category of errors. A Processing Failed error type indicates that the map failed to translate to TraceLink's internal format and therefore cannot hit the back end API. Think of this second step as an "integrity check" against the submitted data. For example, if a serial number is submitted but is assigned to an incorrect product code, an error results. Another example is if a certain event (such as Commission) is submitted, but the serial number included in that event is unrecognized, an error results. The following are some class 2 error examples:

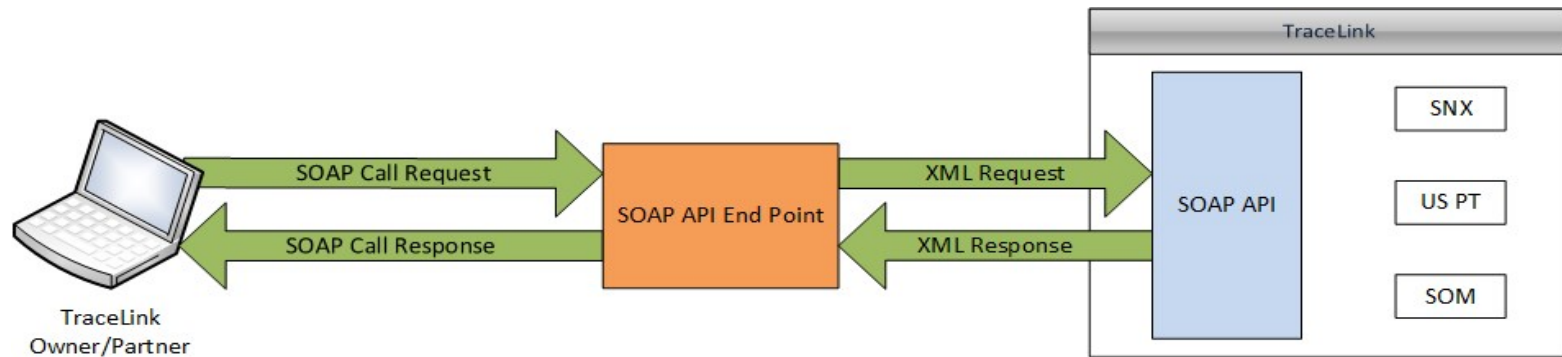

| System Validation                                                                                                       | Error                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Serial Number does not exist.                                                                                           | Serial number [Serial Number] does not exist.                                                                                                                                                                                                                                                          |
| Serial Number is associated to a company or location that differs from the company or location shown in Show Data from. | Location [Location Name] was not valid for serial number [Serial Number].                                                                                                                                                                                                                              |
| Serial Number has a parent.                                                                                             | Operation could not be performed because serial number (child serial number) and serial number (container serial number) are currently in different states or the operation would result in them having different states. Parent and child serial numbers are not permitted to be in different states. |
| Serial Number cannot be updated from its current state to the new state.                                                | Cannot perform operation on serial number [serial number] with item state/serial number state [item state/serial number state]. This operation can only be performed when: [List of item states separated by "or"].                                                                                    |

### Class 3 Errors

Class 3 errors occur when data translation to a third party (Trade Partner) fails due to an internal server error. Class 3 errors are rare, though they may still occur due to missing or incorrect information in the Master Data. The troubleshooting recommendation for Class 3 errors is to first check Master Data, make appropriate edits, and then resubmit the designated file. If Master Data is correctly configured, contact [Support](#) for further assistance.

# Intro to SOAP messages

TraceLink communicates with certain operating systems or programs of choice through SOAP (XML-based messaging protocol) integration. As indicated in the diagram below, the TraceLink applications that use the SOAP API are *Serialized Operations Manager*, *Serial Number Exchange*, and *Product Track*.

For example, if an internal system needs serial numbers, the `SerialNumberRequest` SOAP call is sent from that internal system to TraceLink's SOAP API endpoint, which is the main request-response communication hub. The endpoint simply extracts the XML from the `SerialNumberRequest` call and passes it to the TraceLink platform (the *Serial Number Exchange* app, in this example). *Serial Number Exchange* waits for the XML response containing the requested serial numbers, sends the serial number data back through the endpoint where the SOAP response generates, and sends the response back to the original system. This response also confirms whether the operation is successful or if it fails.

❗ Development platform installation is required prior to integration.

## Authentication

A valid TraceLink Network username and password for HTTP basic authentication validation is needed, as well as a user and app look-up to ensure proper validation of a given request.

❗ To enforce strong security in the TraceLink Track & Trace Services, username:password in plain text is not accepted. To successfully send SOAP calls to TraceLink, Base64 encoding must be used for the username:password and sent in the HTTP Authorization header to conform with the IETF basic authorization standard (<https://tools.ietf.org/html/rfc7617>).

An HTTP 401 Unauthorized client error status response code occurs in the following scenarios:

- A non-Base64 encoded username:password is sent in the HTTP Authorization header.
- A Base64-encoded or plain text username:password is sent in the Username header.
- The Username header is sent.

## App-specific authentication

- Serial Number Exchange requires basic authentication.
- Serialized Operations Manager requires basic authentication. TraceLink also allows the caller to pass a username (possibly a different username from the one used to authenticate), a location type, and location value for the purpose of executing a *Serialized Operations Manager* call. If these values are not provided, TraceLink executes the call at the company level.

| Header        | Usage                                                           | Sample Value                                              | Required                                                                  |
|---------------|-----------------------------------------------------------------|-----------------------------------------------------------|---------------------------------------------------------------------------|
| User          | Use to identify a user making the request (for Audit purposes). | User email or GUID. Example: snxpubco1-mem1@tracelink.com | No. Value defaults to user used in authentication (basic authentication). |
| LocationType  | Use to identify location type executing the call.               | SGLN                                                      | No. If excluded, call is made at the Company level.                       |
| LocationValue | Use to identify location value executing the call.              | 12345.678.10                                              | No, unless LocationType is specified.                                     |

- Compliance Reporting requires basic authentication.

## WSDL access

Access to the Web Services Description Language (WSDL), where the XSDs reside along with other functionality information, is needed for integration. The URL for the WSDL contains the name of the TraceLink environment being accessed, followed by a specified app path. The following are itest WSDL examples by application:

- *Serial Number Exchange*: <https://itestapi.tracelink.com/soap/snx/snrequest?wsdl>
- *Serialized Operations Manager*: <https://itestapi.tracelink.com/soap/som?wsdl>

ⓘ Ensure authentication success before attempting to access the WSDL.

# SOAP API call limits

Before configuring data, query limitations should be noted. The table below outlines the query limitation details for TraceLink SOAP messages:

| API Call                               | Limit   | Description of Limit                                                                         |
|----------------------------------------|---------|----------------------------------------------------------------------------------------------|
| Serial Number Exchange Messages        |         |                                                                                              |
| serialNumberRequestResponse            | 500,000 | The maximum quantity of serial numbers that can be requested is 500,000.                     |
| Serialized Operations Manager Messages |         |                                                                                              |
| Commission                             | 50      | The maximum amount of serial numbers that can be commissioned is 50.                         |
| Decommission                           | 500     | The maximum amount of serial numbers that can be decommissioned is 500.                      |
| GetSerialNumberHierarchy               | 100000  | A maximum of 100,000 serial numbers can be returned with a GetSerialNumberHierarchy request. |
| SetSerialNumberStatus                  | 500     | The serial number status can be set for a maximum of 500 serial numbers.                     |

# Intro to REST messages

TraceLink communicates with certain operating systems and programs of choice through Representational State Transfer (REST) integration. If an internal system needs to query TraceLink for information, an API call is sent from that internal system to the TraceLink REST API endpoint, which is the main request-response communication hub. The TraceLink endpoint extracts the schema from the event call and passes it to the internal system.

Russia Compliance receives the response containing the requested details, routes the information back through the endpoint where the REST response generates, and sends the response back to the original system. This response also confirms whether or not the operation is successful.

## HTTP response status codes

Russia Compliance presents standard response codes to indicate whether or not a specific HTTP request was successful. Response status codes may include, but are not limited to, the following:

### Successful response

|     |                                                                                         |
|-----|-----------------------------------------------------------------------------------------|
| 200 | OK. The request was successful. For GET, this means that the resource has been fetched. |
|-----|-----------------------------------------------------------------------------------------|

### Redirect message

|     |                                                                                                                                             |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------|
| 307 | Temporary Redirect. The client must get the requested resource at another URI with the same HTTP method that was used in the prior request. |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------|

### Client error status codes

|     |                                                                                                                                             |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------|
| 400 | Bad Request. The server could not understand the request due to invalid syntax.                                                             |
| 401 | Unauthorized. The client is unauthenticated, not allowed access, and should re-request credentials.                                         |
| 403 | Forbidden. The request is valid and the client is authenticated, but the client is not allowed access rights to the content for any reason. |

|     |                                                                                                                                      |
|-----|--------------------------------------------------------------------------------------------------------------------------------------|
| 404 | Not Found. The server cannot find the requested item. This can also mean that the endpoint is valid but the resource does not exist. |
|-----|--------------------------------------------------------------------------------------------------------------------------------------|

## Server error status codes

Please contact Support if any of the following errors is encountered:

|     |                                                                                                         |
|-----|---------------------------------------------------------------------------------------------------------|
| 500 | Internal Server Error. The server has encountered an unknown error.                                     |
| 502 | Bad Gateway. The server is working as a gateway to handle the request and received an invalid response. |
| 503 | Service Unavailable. The server is not ready to handle the request.                                     |
| 504 | Gateway Timeout. The server is acting as a gateway and cannot get a response in time.                   |

# How to use this guide

## Read the guidelines table

The following columns are included in the guidelines table for each message. Some messages may not have every column.

- **Data Element** – This column indicates the source/element name included in the message.
- **Occurs** – This column indicates the minimum and maximum amount of times that the particular element may occur within the message. In the example above, the `cmn:FileDate` element must occur a minimum of once and may only occur up to once for the maximum occurrence as indicated by the "1...1". The "\*" character indicates this is an unlimited maximum occurrence.
- **Format** – This column indicates the element's data format type (such as String, Integer, Boolean, Date, or Time).
- **Length** – This column indicates the length of the value for the given element. For the `cmn:FileDate` element above, the value must have at least one character, but does not have a maximum restriction (therefore can be any length). However, be mindful of the description column, as further criteria may be indicated that impacts the field length (e.g. serial number formatting).
- **Enums** – Certain fields are restricted to specified enumeration values. A link to the enumerations and their definitions is provided in this column. For example, `cmn:DeliveryNumber` | **@type** has *LocationId* enumeration values.
- **Req** – Each table indicates whether the element is required for the message. Use the key below to interpret the information in this column:
  - **C = Conditional:** A "C" indicates that this element is contingent on other factors. For example, an element could be required for the U.S. but not for any other country. Therefore the element's requirements are contingent on location. Another conditional scenario is that an element may be mandatory, but only if another related element is present.

ⓘ If indicated as "C", read the "Description" column as conditional values may actually be mandatory depending on use case.

- **M = Mandatory:** An "M" indicates the element must be included in the message.
- **O = Optional:** An "O" indicates that a element may be included in the message but is not required.
- **Description** – Any important notes regarding this section of the message are included here (country requirements, formatting notes, etc.) along with a brief description of the element.

⚠ The order of elements in a message must match the message guidelines

# **MDLP credential management**

# MDLP credential management APIs

Russia Compliance supports exportable and non-exportable certificates to digitally sign reports that are submitted to MDLP.

Owners who use exportable certificates can use the [credentials API](#).

If Owners who use non-exportable certificates choose to build their own app to digitally sign reports, they must integrate with the [Report retrieval APIs](#). Owners can also use the TraceLink-provided Russia Report Signature Appender app to digitally sign reports without any integration. See [Retrieve non-exportable certificates for domestic credentials](#) for more information.

## Digital Certificate Upload (REST)

### Digital Certificate Upload request

#### Authentication

Owners who choose to use exportable certificates for domestic MDLP credentials must use the Web UI and the [Digital Certificate Upload REST API](#). Administrators use the Web UI to configure the app and the REST API to upload digital certificates to a secure TraceLink server in Russia, which MDLP requires for domestic credentials.

An IT professional uses the following message to finish configuring exportable domestic credentials for MDLP by uploading a digital certificate to a secure TraceLink server in Russia, which MDLP requires for domestic credentials. The upload can be completed using a curl command on a computer with a UNIX or Windows 10 operating system.

A TraceLink Administrator must generate the ruconnectorToken (i.e. security token) for the message in the Administration [Web UI](#) when they enter the domestic credentials.

The security token is valid for 30 minutes after generation.

Use a **Post** curl command to the following URL:

- **itest** – <https://itest-upload.ru1.tracelink.com/api/credentials>
- **prod** – <https://upload.ru1.tracelink.com/api/credentials>

Include a **Content-Type** header key-value pair with a value of `multipart/form-data` in the curl command.

## Guidelines

| Data Element     | Occurs Length | Type   | Description                                                                                                                       |
|------------------|---------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| ruconnectorToken | 1...1<br>1/36 | String | <b>Required.</b> The TraceLink provided value when saving credentials for a domestic account. This token is valid for 30 minutes. |
| password         | 1...1<br>-    | String | <b>Required.</b> The password for the digital signature.                                                                          |
| file             | 1...1<br>-    | String | <b>Required.</b> The location on the local computer where the digital signature is located. Include @ before the file name.       |

## Example

```
1 | curl -i -X POST -H "Content-Type: multipart/form-data" -F "ruconnectorToken=0c382d0e-bcd7-4ed7-b502-a1210bb529f9" -F "password=pfx_
password" -F "file=@credentials.pfx" https://itest-upload.ru1.tracelink.com/api/credentials
```

## Errors

There are no errors for in this request. See the Digital Certificate Upload response for examples of a successful and failed response.

## Digital Certificate Upload response

### Guidelines

There are no elements in this response.

## Example - Success

---

```
1 HTTP/1.1 100 Continue
2 HTTP/1.1 201 Created
3 Date: Wed, 26 Feb 2020 19:44:33 GMT
4 Content-Length: 0
```

## Example - Failure

---

```
1 HTTP/1.1 100 Continue
2 HTTP/1.1 400 Bad Request
3 Date: Fri, 28 Feb 2020 14:49:20 GMT
4 Content-Type: text/plain
5 Content-Length: 30
6 Ru Connector Token has expired
```

# Report retrieval APIs

---

Owners can build their own app to retrieve reports by using the following APIs in this order:

## Tokens

Use this message to retrieve the token provided by TraceLink to use in the Tasks and Task Result APIs. The token is valid for 600 minutes i.e. 10 hours. The User ID and Password are provided when Administrators [configure Russia Compliance](#).

## Authentication

---

Use a **POST** curl command to the following URL:

- **itest** – <https://itest-upload.ru1.tracelink.com/api/token>
- **prod** – <https://upload.ru1.tracelink.com/api/token>

Include a **Content-Type** header key-value pair with a value of `application/json` in the curl command.

## Request guidelines

| Data Element | Type   | Description                                                                                                                                   |
|--------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| userId       | String | <b>Required.</b> The TraceLink-provided value when saving credentials for a domestic account using the Certificate Digest and Certificate ID. |
| password     | String | <b>Required.</b> The TraceLink-provided value when saving credentials for a domestic account using the Certificate Digest and Certificate ID. |

## Request examples

### Curl

```
1 curl --location "https://qe-upload.ru1.tracelink.com/api/token" ^
2 --header "Content-Type: application/json" ^
3 --data '{"userId":"m?Hw!8InPM%sd44K","password":"N(1^dQ6Q#(x#pj<I"}'
```

### JSON

```
1 {
2   "userId": "i0lNgFiBQ9WurPil",
3   "password": "!SnuBb0AwR)Yizw="
4 }
```

## Response guidelines

| Data Element   | Type   | Description                                                                                                           |
|----------------|--------|-----------------------------------------------------------------------------------------------------------------------|
| token          | String | The token that is obtained for a User ID and Password combination, and must be used in the Task and Task Result APIs. |
| lifeTime       | String | The validity of the token in minutes. Default value is 600 minutes.                                                   |
| certThumbprint | String | The Thumbprint credentials that are configured for MDLP.                                                              |
| errorMessage   | String | Displays an error message for a failed authentication.                                                                |

## Response example

## Success

```
1 {
2   "token":
3     "eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJjb2lwYW55SWQ0IiwzMl1Njk1Yi1kODJlLTRkMmQtODVmOC01NTZhMjFhZjJlNDkiLCJwYXNzd29yZCI6IiFTTnVCYk9Bd1IpW

```

## Failure

```
1 {
2   "errorMessage": "Authentication failed. Please check your user ID and password, or ensure all required keys are provided."
3 }
```

## Errors

| Element  | Error Message                                                                                            | Description                                                     |
|----------|----------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| User ID  | Authentication failed.                                                                                   | The error occurs if the user ID is incorrect.                   |
|          | Authentication failed. Please check your user ID and password, or ensure all required keys are provided. | The error occurs if either user ID or password is not provided. |
| Password | Authentication failed.                                                                                   | The error occurs if the password is incorrect.                  |
|          | Authentication failed. Please check your user ID and password, or ensure all required keys are provided. | The error occurs if either user ID or password is not provided. |

## Tasks

Use this message to retrieve up to 5 reports that require a signature. The reports must be signed and returned with the Task Result API while the token is still valid (i.e. within 600 minutes of retrieving the token).

## Authorization

Use a **GET** curl command to the following URL:

- **itest** – `https://itest-upload.ru1.tracelink.com/api/tasks`
- **prod** – `https://upload.ru1.tracelink.com/api/tasks`

Include a **Content-Type** header key-value pair with a value of `application/json` in the curl command.

Include an authorization `token` header value with the token provided by TraceLink in the Token's response.

This request does not include any elements in the payload.

## Request example

```
1 | curl --location "https://itest-upload.ru1.tracelink.com/api/tasks" ^
```

```

2 | --header ""Authorization":
  | "eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.eyJjb21wYW55SWQiOiIwZmI1Njk1Yi1kODJlLTRkMmQtODVmOC01NTZhMjFhZj1jNDkiLCJsb2NhZGlvbklkIjoimDAwMDAwMDAxMjE0MzUiLCJleHAiOjE3MjA3NDA4Mzd9.3TXEOR6B1AJd9hwMKU3y1Gy6OmSj_U_d_E0s2aYewBo""

```

## Response guidelines

| Data Element                   | Type   | Description                                                                                                                                                                                                                                       |
|--------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| taskList                       | String | <b>Required.</b> The Russia Compliance reports that require a signature. The signed reports must be returned with the Task Result request in the same order as they are provided in this response.                                                |
| taskId                         | String | Unique identifier for each report.                                                                                                                                                                                                                |
| signingTaskContentPreSignedUrl | String | Presigned URL of the request file that needs to be signed before submitting to the MDLP and responded with the <code>taskId</code> as primary identifier for the Task Result endpoint.                                                            |
| signatureType                  | String | The signature type for the report. Valid values: <ul style="list-style-type: none"> <li><code>Attached</code> - The signature is attached to the report.</li> <li><code>Detached</code> - The signature is not attached to the report.</li> </ul> |
| signingPayload                 | String | Token to be signed in case the <code>taskId</code> is <code>mdlp_token_request</code> or <code>oms_token_request</code> .                                                                                                                         |
| errorMessage                   | String | Displays if the token is invalid.                                                                                                                                                                                                                 |
| errorCode                      | String | Displays if the token is invalid.                                                                                                                                                                                                                 |

## Errors

| Element       | Error Message           | Description                                                                 |
|---------------|-------------------------|-----------------------------------------------------------------------------|
| Authorization | Authentication Failure. | The error occurs if the token provided in the header is invalid or expired. |

## Task Result

Use this message to return the signed reports to Russia Compliance. Each request can only contain one report at a time

## Authorization

Use a **POST** curl command to the following URL:

- **itest** – <https://itest-upload.ru1.tracelink.com/api/taskResult>
- **prod** – <https://upload.ru1.tracelink.com/api/taskResult>

Include a **Content-Type** header key-value pair with a value of `application/json` in the curl command.

Include an authorization `token` header value with the token provided by TraceLink in the Token's response.

## Request guidelines

| Data Element     | Type   | Description                                                                                                                                                                                                                                       |
|------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| signedData       | String | <b>Required.</b> The <code>signingPayload</code> or <code>signingTaskContentPreSignedUrl</code> from the Task response that identifies the report.                                                                                                |
| taskId           | String | <b>Required.</b> The unique identifier of the report from the Task response.                                                                                                                                                                      |
| status           | String | <b>Required.</b> The status of the digital signature. Valid values: <ul style="list-style-type: none"> <li>• <code>SUCCESS</code> - The report is signed successfully.</li> <li>• <code>ERROR</code> - The report could not be signed.</li> </ul> |
| signingPayload   | String | <b>Optional.</b> The <code>signingPayload</code> from the Task response that identifies the report.                                                                                                                                               |
| errorCode        | String | Required if the status is <code>ERROR</code> . Valid value is <code>INTERNAL_FAILURE</code> .                                                                                                                                                     |
| errorDescription | String | Required if the status is <code>ERROR</code> . The description of the error.                                                                                                                                                                      |

## Request examples

```

1 | {
2 |   "signedData": "<signedValue>",

```

```

```

## Response guidelines

If the request is successful, there is no response payload. The following elements are only returned if an error occurs.

| Data Element | Type   | Description                                                                                                                                                                          |
|--------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| errorMessage | String | The description of the error that occurred.                                                                                                                                          |
| errorCode    | String | The error code. Valid values: <ul style="list-style-type: none"><li>101 - Authentication failure.</li><li>105 - The payload of the request exceeded the maximum 5KB limit.</li></ul> |

## Response example

```
1  {
2  "errorMessage": "Payload size exceeds the configured maximum limit (in KB): 5",
3  "errorCode": 105
}
```

4 | }

Errors

| Element              | Error Message                                                  | Description                                                                        |
|----------------------|----------------------------------------------------------------|------------------------------------------------------------------------------------|
| Authorization        | Authentication Failure                                         | The error occurs if the token provided in the header is invalid or expired.        |
| Request message size | Payload size exceeds the configured maximum limit (in KB): [5] | The error occurs if the payload size exceeds the configured maximum limit of 5 KB. |

# **Serial number and crypto code management**

# Crypto code and serialization APIs

Use the following request and response messages to fetch a certain quantity of serial numbers in the appropriate format when serializing product on the packaging line. The request message specifies the information that is needed, and the response message returns the serial numbers and associated crypto codes, if applicable. The serial numbers can then be added to products on the packaging line.

## Serial Number Exchange Request & Response (XML)

### Serial Number Exchange Request

#### Guidelines

**Message Type:** SNX\_REQUEST

**Info Exchange Display Name:** Serial Number Request

❗ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

| Data Element          |                       |                        | Occurs<br>Length | Type   | Description                                                                |
|-----------------------|-----------------------|------------------------|------------------|--------|----------------------------------------------------------------------------|

Please contact Support if this error is encountered. |                                                                                                                         |                                                                                                                                                |

## Serial Number Exchange Response

## Guidelines

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 2 hours.

**Message Type:** SNX\_RESPONSE

**Info Exchange Display Name:** Serial Number Response

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

# Serial Number Exchange Request & Response (SAP ATTP)

## Serial Number Exchange Request

### Guidelines

**Message Type:** SNX\_REQUEST

**Info Exchange Display Name:** Serial Number Request

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

| Data Element        |               |           | Occurs Length | Type   | Description                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|---------------|-----------|---------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n1:SNR_REQ_ASYNC_IN |               |           | 1...1<br>-    | -      | <b>Required.</b> Root data element.                                                                                                                                                                                                                                                                                                                                                     |
|                     | IB_ONLY_EXACT |           | 0...1<br>0/1  | String | Some consumer services cannot handle partial responded serial number requests (internal SAP ATTP buffer does have enough numbers. The request can only be responded partial). This parameter controls whether partial responses are allowed.<br>"X": The parameter is set to true. Full quantity of the numbers or nothing.<br>"": The parameter is blank. Partial quantity is allowed. |
|                     | IS_SSCC       |           | 0...1<br>-    | -      | Conditionally required for SSCC requests. SSCC Information.                                                                                                                                                                                                                                                                                                                             |
|                     |               | GCP       | 1...1<br>0/12 | String | <b>Required.</b> The Global company prefix that is assigned to the business partner in the system (e.g. 4298382). This Request Id is required by TraceLink. TraceLink uses this value in the Serial Number Response message to link the request and the response.                                                                                                                       |
|                     |               | EXT_DIGIT | 1...1<br>0/1  | String | <b>Required.</b> In SAP ATTP, the SSCC Extension Digit is the first digit of the serial number (e.g. 2).                                                                                                                                                                                                                                                                                |
|                     | IS_TRADE_ITEM |           | 0...1<br>-    | -      | <b>Conditionally required</b> for GTIN requests. SGTIN Information.                                                                                                                                                                                                                                                                                                                     |

| Data Element |                   | Occurs Length | Type    | Description                                                                                                                                                                                                                                                                                                                                                                            |
|--------------|-------------------|---------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | TRADE_ITEM_TYPE   | 1...1<br>0/10 | String  | <b>Required.</b> This parameter defines trade item type.<br>Value = <b>GTIN</b> (e.g. GTIN).                                                                                                                                                                                                                                                                                           |
|              | TRADE_ITEM_ID     | 1...1<br>0/40 | String  | <b>Required.</b> Depends on TRADE_ITEM_TYPE value (e.g. 14298382900015).<br>The GTIN-14 for the required SGTIN and AI(01)+AI(21) serial numbers. The GTIN-14 also informs the logistical unit. Use only when NumberEncoding is for SGTIN and AI(01)+AI(21).                                                                                                                            |
|              | IV_LIST_RANGE     | 1...1<br>0/1  | String  | <b>Required.</b> Defines the type of the serial number response. Values: (e.g. L) <ul style="list-style-type: none"> <li><b>R</b> – The response contains a range.</li> <li><b>L</b> – The response contains a list. (Default)</li> </ul>                                                                                                                                              |
|              | IV_READILY_ENCODE | 1...1<br>0/1  | String  | <b>Required.</b> In addition to the numbers or range, the request also optionally provides readily encoded data in either a GS1 element string or in EPC URI:<br>1: Encoding in GS1 Element format. <div> <i>i</i> The Serial Number Exchange Response (SAP ATTP) message includes Russia crypto codes if enabled in the serial number template. </div> 2: Encoding in EPC URI format. |
|              | IV_SIZE           | 1...1<br>1/*  | Integer | <b>Required.</b> Quantity of serial numbers within range request (e.g. 1000).                                                                                                                                                                                                                                                                                                          |
|              | IV_SYSTEM         | 1...1<br>0/60 | String  | <b>Required.</b> The system name that has been created for the caller in SAP Advanced Track and Trace for Pharmaceuticals (e.g. 5060173540005 TRACELINK). <div> <i>i</i> TraceLink uses this field to store the Sender and Receiver information separated by a pipe ( ) character. </div>                                                                                              |

## Example

TraceLink does not provide examples for third-party message format. Please contact SAP for message examples pertaining to this message.

## Serial Number Exchange Response

### Guidelines

**Message Type:** SNX\_RESPONSE

**Info Exchange Display Name:** Serial Number Response

 When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

| Data Element         | Occurs Length | Type | Description                         |
|----------------------|---------------|------|-------------------------------------|
| n1:SNR_REQ_ASYNC_OUT | 1...1<br>-    | -    | <b>Required.</b> Root data element. |

| Data Element  |                 | Occurs<br>Length | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|-----------------|------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IB_ONLY_EXACT |                 | 0...1<br>0/1     | String | Some consumer services cannot handle partial responded serial number requests (internal SAP ATTP buffer does have enough numbers. The request can only be responded partial). This parameter controls whether partial responses are allowed. Values:<br><b>X</b> – The parameter is set to true. Full quantity of the numbers or nothing.<br>" " – The parameter is blank. Partial quantity is allowed. |
| IS_RANGE      |                 | 1...1<br>-       | -      | Contains serial number ranges for a range request. In case of a list request, it will be empty.                                                                                                                                                                                                                                                                                                         |

## Serial Number Manager Request and Response (Verify Brand)

### Serial Number Manager Request

#### Guidelines

Use this message to replenish serial numbers from the Verify Brand system.

**Message Type:** SNM\_REQUEST

**Info Exchange Display Name:** Serial Number Replenish Request

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

| Data Element          | Occurs | Format | Length | Enums | Req | Description                                        |
|-----------------------|--------|--------|--------|-------|-----|----------------------------------------------------|
| snm:SNMRequestType    | 1...1  | -      | -      | -     | M   | Root data element.                                 |
| snm:ControlFileHeader | 1...1  | -      | -      | -     | M   | Serial Number Manager control header record group. |

| Data Element |  |                         | Occurs | Format | Length | Enums                        | Req | Description                                                                                                                                                                              |

|----------------------|--------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Class 1 Errors       |                                                                                                              |                                                                                                                                                                          |
| cmn:NumberEncoding   | Valid number encoding code is required !!!                                                                   | The error occurs if the source is empty or null, or is not a valid value from the enumeration list.                                                                      |
| cmn:ObjectIdentifier | Only one of CompanyPrefixObjectKey OR GTIN14ObjectKey OR CNSubtypeObjectKey OR NTINObjectKey is required !!! | The error occurs if none, or more than one, of the following are present: cmn:CNSubtypeObjectKey, cmn:CompanyPrefixObjectKey, cmn:GTIN14ObjectKey, or cmn:NTINObjectKey. |
| Class 2 Errors       |                                                                                                              |                                                                                                                                                                          |

| Data Element                                                                                                                                                      | Error Message | Description |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-------------|
| -                                                                                                                                                                 | -             | -           |
| Class 3 Errors                                                                                                                                                    |               |             |
| The following is thrown for all Class 3 errors: "INTERNALERROR=Internal error from server [server details]." Please contact Support if this error is encountered. |               |             |

## Serial Number Manager Response

### Guidelines

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 2 hours.

**Message Type:** SNM\_RESPONSE

**Info Exchange Display Name:** Serial Number Replenish Response

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

# Remove crypto codes APIs

Use the following messages to remove crypto key and crypto code attributes from specified serial numbers. When a Remove Crypto Codes request is successful, the response includes an **AsyncID**. Use this token in the Fetch Remove Crypto Codes Result request to retrieve the status of the associated Remove Crypto Codes message.

Access to the Web Services Description Language (WSDL), where the XSDs reside along with other functionality information, is needed for integration. The URL for the WSDL contains the name of the TraceLink environment being accessed, followed by a specific app path. The following are the itest and prod WSDLs for removing crypto codes:

- *itest*: <https://itestapi.tracelink.com/soap/crypto?wsdl>
- *prod*: <https://api.tracelink.com/soap/crypto?wsdl>

Ensure authentication success before attempting to access the WSDL.

# Fetch Remove Crypto Codes Result (SOAP)

## Fetch Remove Crypto Codes Result Request

### Guidelines

| Data Element     |                |                                 | Occurs<br>Length | Type   | Description                                                                               |
|------------------|----------------|---------------------------------|------------------|--------|-------------------------------------------------------------------------------------------|
| soapenv:Envelope |                |                                 | 1...1<br>1/*     | -      | <b>Required.</b> The SOAP envelope.                                                       |
|                  | soapenv:Header |                                 | 1...1<br>-       | -      | <b>Required.</b> Not used.                                                                |
|                  | soapenv:Body   |                                 | 1...1<br>-       | -      | <b>Required.</b> The SOAP message body.                                                   |
|                  |                | urn:FetchRemoveCryptoCodeResult | 1...1<br>-       | -      | <b>Required.</b> The Fetch Remove Crypto Codes Result request message.                    |
|                  |                | RequestId                       | 1...1<br>0/*     | String | <b>Required.</b> The <b>AsyncID</b> received in the Remove Crypto Codes response message. |

### Example

```
<soapenv:Envelope xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/" xmlns:urn="urn:tracelink:soap">
  <soapenv:Header/>
  <soapenv:Body>
    <urn:FetchRemoveCryptoCodeResult>
      <RequestId>bbda2bfe-0b35-49bb-aa4b-09a0478abce0</RequestId>
    </urn:FetchRemoveCryptoCodeResult>
  </soapenv:Body>
</soapenv:Envelope>
```

## Errors

| Error Code | Error Messages                                                                                    |
|------------|---------------------------------------------------------------------------------------------------|
| VALIDATION | Incorrect arguments: Only specify serial numbers in the Items list or both a GTIN and Lot Number. |
| VALIDATION | The following serial number(s) in the request do not exist: <serialNumber1>, <serialNumber2>.     |
| VALIDATION | LotNumber <lotNumber> not found for GTIN <GTINValue>.                                             |

## Fetch Remove Crypto Codes Result Response

### Guidelines

- If **Success** = **true** and neither **TLResponsePayload** nor **ExceptionReturn** is present, the serial number(s) in the Remove Crypto Codes message successfully had their crypto key and crypto code attributes removed.
- If **Success** = **true** and **TLResponsePayload** is present, the Remove Crypto Codes message was successfully submitted but is still being processed.
- If **Success** = **true** and **ExceptionReturn** is present, the Remove Crypto Codes message was successfully submitted but there is at least one error.

      </TLResponse>  
    </ns3:FetchRemoveCryptoCodesResultResponse>  
  </S:Body>  
</S:Envelope>
```

# **Manufacturing and packaging**

# Product release APIs

## Why do I use these messages?

Use the following messages to update the status of serial numbers within a lot to **Quality Released**, indicating that the lot is ready to be released to the market (e.g. it has passed quality inspection).

 Serial numbers can be released before being commissioned in TraceLink. If serial numbers are not associated with the item code and lot number specified in the message, TraceLink preserves the item code and lot number association and updates serial numbers for the lot with the Product Release item attribute when they are commissioned.

## Which reports do these messages generate?

These messages generate one of the following reports in the Russia Compliance application if their contents meet the report conditions:

- [OMS Foreign Utilisation](#) and [915 - Multi Pack](#) (generated together) – The OMS Foreign Utilisation report captures information about serialized items that are manufactured in a country other than Russia before being imported to Russia for distribution and the 915 - Multi Pack report captures the aggregation hierarchy of those items.
- [313 - Register Product Emission](#) – The 313 - Register Product Emission captures information about serialized items that are manufactured and released in Russia.

## Product Release (XML)

### Guidelines

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 4 hours.

**Message Type:** SOM\_PRODUCT\_RELEASE.

**Info Exchange Display Name:** Product Release

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

## Product Release Event (EPCIS v1.2)

### Guidelines

Use this message to exchange data between a CMO and a Pharmaceutical Manufacturer. This message communicates Commission, Aggregation, and Product Release data in a single message.

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 4 hours.

**Message Type:** SOM\_PRODUCT\_RELEASE\_EVENT

**Info Exchange Display Name:** Product Release

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

⚠ NTINs *must* follow the [GS1 Guidance](#) standards as found on the GS1 website.

- Ex: urn:epc:id:sgtin:415001647778.0.100000000022
- Format: urn:epc:id:sgtin:[company prefix].[indicator digit].[item ref].[serial number]

Information regarding NTINs cannot be exchanged with trade partners unless the specific format outlined above is followed. If using an NTIN without following this format, an outbound error occurs when passing data from TraceLink to a trade partner.

|              |  |  |  |  |  | tl:extensionField    | 0...*<br>-    | -        | Customer extension point to pass in 1 or more name/value pairs containing additional data attributes not already supported in this message. If this element group is populated both <b>tl:fieldName</b> and <b>tl:fieldValue</b> must be populated. These extensions are not stored by TraceLink and are used only for outbound mapping purposes when there is a requirement to provide additional data to a trade partner for this message, such as when a CMO is required to provide additional data fields to the brand owner. In this case, TraceLink would have a custom map for that trade partner to map these fields outbound. Different trade partners may have different field requirements and may therefore require that <b>tl:extensionField</b> be populated differently per trade partner. |
|              |  |  |  |  |  | tl:fieldName         | 1...1<br>1/*  | String   | <b>Conditionally required</b> if the <b>tl:extensionField</b> element group is populated. Populate with the field name provided by the trade partner that will be receiving the mapped outbound message. The field name must match the field name provided by the trade partner exactly, including case, so it is properly detected in the outbound mapping.                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|              |  |  |  |  |  | tl:extensionField        | 0...*<br>-    | -      | <p>Customer extension point to supply one or more name/value pairs containing additional data attributes not already supported in this message.</p> <p> If this element group is populated both <b>tl:fieldName</b> and <b>tl:fieldValue</b> elements must be populated.</p> <p> These extensions are not stored by TraceLink and are only used for outbound mapping purposes when there is a requirement to provide additional data to a partner for this message, such as when a CMO is required to provide additional data fields to the brand owner. In this case, TraceLink would have a custom map for that partner to map these fields outbound. Different partners may have different field requirements and may therefore require that the ExtensionField be populated differently per trade partner.</p> |
|              |  |  |  |  |  | tl:fieldName             | 1...1<br>1/*  | String | <b>Required.</b> The field name provided by the partner that will be receiving the mapped outbound message. <sup>3</sup>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Example

```

<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:ReleaseProductResponse xmlns:ns2="urn:tracelink:soap" xmlns:ns3="http://tracelink.com/som">
      <TLResponse>
        <Success>true</Success>
      </TLResponse>
    </ns2:ReleaseProductResponse>
  </S:Body>
</S:Envelope>

```

# End of Batch APIs

## Why do I use these messages?

Use the following messages to declare an End of Batch, which captures the quantity of serial numbers produced for a specific product and lot and confirms that the packaging line system correctly fulfilled the production request. TraceLink verifies that the quantity of serial numbers in the End of Batch matches the quantity that were commissioned for the lot and captured in a Disposition Assigned message (see the *Serial Number Exchange API Guide* for more information). TraceLink might also verify that the quantity of serial numbers falls within the expected batch yield threshold for the product, if configured in Product Master Data.

## Which reports do these messages generate?

These messages generate the [OMS Domestic Utilisation](#) and [915 - Multi Pack](#) reports in the Russia Compliance application if their contents meet the report conditions.

## End of Batch (XML)

### Guidelines

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 4 hours.

**Message Type:** SNX\_END\_OF\_BATCH

**Info Exchange Display Name:** End of Batch Notification

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

## End of Batch Event (EPCIS v1.2)

### Guidelines

CMOs use this message to declare an End of Batch on behalf of the product's MAH, which records the End of Batch in the MAH's system and sends commission and aggregation data to the system. This message communicates Commission, Aggregation, and End of Batch data from the CMO to the MAH.

**Message Type:** SOM\_END\_OF\_BATCH\_EVENT

**Info Exchange Display Name:** End of Batch Event

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

⚠ NTINs *must* follow the [GS1 Guidance](#) standards as found on the GS1 website.

- Ex: urn:epc:id:sgtin:415001647778.0.100000000022
- Format: urn:epc:id:sgtin:[company prefix].[indicator digit][item ref].[serial number]

Information regarding NTINs cannot be exchanged with trade partners unless the specific format outlined above is followed. If using an NTIN without following this format, an outbound error occurs when passing data from TraceLink to a trade partner.

# Aggregation APIs

## Why do I use these messages?

Use these messages to capture the aggregation of serial numbers to a parent container.

## Which reports do these messages generate?

These messages generate [911 - Unit Pack](#) and [914 - Unit Append](#) reports in the Russia Compliance application if the items being aggregated have a target market of Russia. TraceLink submits the appropriate report to MDLP, based on which report MDLP is prepared to accept.

## ESM Aggregation (EPCIS v1.2)

### Guidelines

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 2 hours.

**Message Type:** SOM\_ESM\_AGGREGATE

**Info Exchange Display Name:** ESM Aggregate

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

⚠ NTINs *must* follow the [GS1 Guidance](#) standards as found on the GS1 website.

- Ex: urn:epc:id:sgtin:415001647778.0.100000000022
- Format: urn:epc:id:sgtin:[company prefix].[indicator digit][item ref].[serial number]

Information regarding NTINs cannot be exchanged with trade partners unless the specific format outlined above is followed. If using an NTIN without following this format, an outbound error occurs when passing data from TraceLink to a trade partner.

## Aggregate (SOAP)

### Aggregate Request

#### Guidelines

❗ When sending multiple aggregation events (i.e. aggregations, disaggregations, or a combination thereof) at the same time, use the [Aggregation Update](#) message instead of individual Aggregation or Disaggregation messages.

❗ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

The following data is sent in the request to TraceLink:

| Data Element     | Occurs Length | Type | Description                                                  |
|------------------|---------------|------|--------------------------------------------------------------|
| soapenv:Envelope | 1...1<br>-    | -    | <b>Required.</b> SOAP Envelope root element.                 |
| soapenv:Header   | 1...1<br>-    | -    | <b>Required.</b> SOAP Message Header. Not used by TraceLink. |
| soapenv:Body     | 1...1<br>-    | -    | <b>Required.</b> SOAP Message Body.                          |
| urn:Aggregate    | 1...1         | -    | <b>Required.</b> Aggregate Message.                          |

| Data Element |  |  |                  | Occurs Length | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Aggregate Response

### Guidelines

The following data is included in the message response:

| Data Element          | Occurs Length | Type | Description                                  |
|-----------------------|---------------|------|----------------------------------------------|
| S:Envelope            | 1...1<br>-    | -    | <b>Required.</b> SOAP Envelope root element. |
| S:Body                | 1...1<br>-    | -    | <b>Required.</b> SOAP Message Body.          |
| ns2:AggregateResponse | 1...1<br>-    | -    | <b>Required.</b> Aggregate response message. |
| TLResponse            | 0...1         | -    | <b>Required.</b> The TraceLink response.     |

| Data Element |  |  |  |  |                  | Occurs Length | Type   | Description                                                                                                    |
|--------------|--|--|--|--|------------------|---------------|--------|----------------------------------------------------------------------------------------------------------------|
|              |  |  |  |  | Success          | 0...1<br>-    | -      | <b>Required.</b> Indicates if the Aggregation request successfully processed. <sup>1</sup>                     |
|              |  |  |  |  | ExceptionReturn  | 0...1<br>-    | -      | <b>Conditionally required</b> if <b>Success</b> = <b>false</b> ; omitted otherwise. Error information.         |
|              |  |  |  |  | CallException    | 1...*<br>-    | -      | <b>Required.</b> Error information including the exception code and error message if available.                |
|              |  |  |  |  | ExceptionCode    | 0...1<br>0/*  | String | <b>Required.</b> Error code.                                                                                   |
|              |  |  |  |  | ExceptionMessage | 0...1<br>0/*  | String | <b>Conditionally required</b> if error condition is available. Message that further describes error condition. |

## Example

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:AggregateResponse xmlns:ns2="urn:tracelink:soap" xmlns:ns3="http://tracelink.com/som">
      <TLResponse>
        <Success>true</Success>
      </TLResponse>
    </ns2:AggregateResponse>
  </S:Body>
</S:Envelope>
```

## Aggregation Update (XML)

### Guidelines

Use this message to capture both aggregation and disaggregation events simultaneously. If the items being disaggregated have a Russia target market, this message initiates the [913 - Unit Extract](#) report in addition to the [911 - Unit Pack](#) and [914 - Unit Append](#) reports.

<sup>1</sup>true

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 2 hours.

**Message Type:** SOM\_AGGREGATE\_UPDATE

**Info Exchange Display Name:** Aggregate Update

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

❗ The MDLP Bulk API currently has a limit of 20 events per message.

# Aggregation Update (EPCIS v1.2)

## Guidelines

Use this message to capture both aggregation and disaggregation events simultaneously. If the items being disaggregated have a Russia target market, this message initiates the [913 - Unit Extract](#) report in addition to the [911 - Unit Pack](#) and [914 - Unit Append](#) reports.

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 2 hours.

**Message Type:** SOM\_AGGREGATE\_UPDATE

**Info Exchange Display Name:** Aggregate Update

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

❗ The MDLP Bulk API currently has a limit of 20 events per message.

# Aggregation Update (SOAP)

## Aggregation Update Request

### Guidelines

The Aggregation Update message allows Pharmaceutical Manufacturer Owners to report the aggregation and disaggregation of product simultaneously to account for warehouse packing activities. Each message can contain multiple aggregations or disaggregations.

ⓘ When sending multiple aggregation events (i.e. aggregations, disaggregations, or a combination thereof) at the same time, use this message instead of individual Aggregation or Disaggregation messages.

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

⚠ The MDLP Bulk API currently has a limit of 20 events per message.

The following data is sent in the request to TraceLink:

| Elements         |                |                          | Occurs Length | Type | Notes                                                                                       |
|------------------|----------------|--------------------------|---------------|------|---------------------------------------------------------------------------------------------|
| soapenv:Envelope |                |                          | 1...1<br>-    | -    | <b>Required.</b> The SOAP envelope root element.                                            |
|                  | soapenv:Header |                          | 1...1<br>-    | -    | <b>Required.</b> Not used. The SOAP message header.                                         |
|                  | soapenv:Body   |                          | 1...1<br>-    | -    | <b>Required.</b> The SOAP message body.                                                     |

|                | Cannot perform operation on serial number [Serial Number] with item state [Serial Number Status]. This operation can only be performed when the serial number is Available or Blocked or Picked. |
|                | Serial Number <Serial> cannot be disaggregated because it was not previously aggregated to <ParentSerial>.                                                                                       |
|                | Event timestamp is earlier than the aggregation date for serial number <Serial>.                                                                                                                 |

Aggregation Update Response

Guidelines

⚠ The MDLP Bulk API currently has a limit of 20 events per message.

The following data is included in the message response:

| Data Element          |  |  |  |  | Occurs Length | Type   | Description                                                                                                                                                              |
|-----------------------|--|--|--|--|---------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| S:Envelope            |  |  |  |  | 1...1<br>-    | -      | <b>Required.</b> The SOAP Envelope root element.                                                                                                                         |
| S:Body                |  |  |  |  | 1...1<br>-    | -      | <b>Required.</b> The SOAP Message Body.                                                                                                                                  |
| ns2:AggregateResponse |  |  |  |  | 1...1<br>-    | -      | <b>Required.</b> The Aggregation Update response message.                                                                                                                |
| TLResponse            |  |  |  |  | 1...1<br>-    | -      | <b>Required.</b> The TraceLink response.                                                                                                                                 |
| Success               |  |  |  |  | 1...1<br>-    | -      | <b>Required.</b> Indicates if the Aggregation Update request successfully processed. <sup>1</sup>                                                                        |
| ExceptionReturn       |  |  |  |  | 0...1<br>-    | -      | <b>Conditionally required</b> if <b>Success</b> = <code>false</code> . Populated with error information only if <b>Success</b> = <code>false</code> , otherwise omitted. |
| CallException         |  |  |  |  | 1...*<br>-    | -      | <b>Required.</b> Contains error information including the exception code and error message, if available.                                                                |
| ExceptionCode         |  |  |  |  | 1...1<br>0/*  | String | <b>Required.</b> Error code.                                                                                                                                             |
| ExceptionMessage      |  |  |  |  | 0...1<br>0/*  | String | <b>Conditionally required</b> if an error occurred. Message that further describes error condition, if available.                                                        |

## Example

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns3:AggregateUpdateResponse xmlns:ns2="http://tracelink.com/som" xmlns:ns3="urn:tracelink:soap">
      <TLResponse>
        <Success>true</Success>
      </TLResponse>
    </ns3:AggregateUpdateResponse>
  </S:Body>
</S:Envelope>
```

# Disaggregation APIs

## Why do I use these messages?

Use the following messages to capture the disaggregation of serial numbers from a parent container.

## Which report do these messages generate?

These messages generate [913 - Unit Extract](#) report in the Russia Compliance application if the items being disaggregated have a target market of Russia.

## ESM Disaggregate (EPCIS v1.2)

### Guidelines

Use this message to notify upstream partners about disaggregation.

**Message Type:** SOM\_ESM\_DISAGGREGATE

**Info Exchange Display Name:** ESM Disaggregate

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

⚠ NTINs *must* follow the [GS1 Guidance](#) standards as found on the GS1 website.

- Ex: urn:epc:id:sgtin:415001647778.0.100000000022
- Format: urn:epc:id:sgtin:[company prefix].[indicator digit].[item ref].[serial number]

Information regarding NTINs cannot be exchanged with trade partners unless the specific format outlined above is followed. If using an NTIN without following this format, an outbound error occurs when passing data from TraceLink to a trade partner.

| Data Element        | Occurs Length | Type | Description                                  |
|---------------------|---------------|------|----------------------------------------------|
| epcis:EPCISDocument | 1...1         | -    | <b>Required.</b> EPCIS message root element. |

| Data Element |                |                                     |                    | Occurs Length | Type     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Please contact Support if this error is encountered. |                                                                                                   |                                                                                               |

# Disaggregate (SOAP)

## Disaggregation Request

### Guidelines

❶ When sending multiple aggregation events (i.e. aggregations, disaggregations, or a combination thereof) at the same time, use the [Aggregation Update](#) message instead of individual Aggregation or Disaggregation messages.

❷ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

The following data is sent in the request to TraceLink:

| Data Element        |  |  |  |  | Occurs Length | Type | Description                                                                                                                                                                                           |
|---------------------|--|--|--|--|---------------|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| soapenv:Envelope    |  |  |  |  | 1...1<br>-    | -    | <b>Required.</b> SOAP Envelope root element.                                                                                                                                                          |
| soapenv:Header      |  |  |  |  | 1...1<br>-    | -    | Not used by TraceLink.                                                                                                                                                                                |
| soapenv:Body        |  |  |  |  | 1...1<br>-    | -    | <b>Required.</b> SOAP Message Body.                                                                                                                                                                   |
| urn:Disaggregate    |  |  |  |  | 1...1<br>-    | -    | <b>Required.</b> Disaggregate message.                                                                                                                                                                |
| DisaggregateRequest |  |  |  |  | 0...1<br>-    | -    | <b>Required.</b> The disaggregate request message to disassociate child serial numbers from a parent container.                                                                                       |
| Container           |  |  |  |  | 0...1<br>-    | -    | The parent container's serial number. If <b>Container</b> is specified, all items must currently be a child of the specified container. If omitted, <b>Strict</b> must be set to <code>false</code> . |

## Example

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:DisaggregateResponse xmlns:ns2="urn:tracelink:soap" xmlns:ns3="http://tracelink.com/som">
      <TLResponse>
        <Success>true</Success>
      </TLResponse>
    </ns2:DisaggregateResponse>
  </S:Body>
</S:Envelope>
```

# Aggregation Update (XML)

## Guidelines

Use this message to capture both aggregation and disaggregation events simultaneously. If the items being disaggregated have a Russia target market, this message initiates the [911 - Unit Pack](#) and [914 - Unit Append](#) reports in addition to the [913 - Unit Extract](#) report.

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 2 hours.

**Message Type:** SOM\_AGGREGATE\_UPDATE

**Info Exchange Display Name:** Aggregate Update

<sup>1</sup>SNOTFOUND

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

❗ The MDLP Bulk API currently has a limit of 20 events per message.

## Aggregation Update (EPCIS v1.2)

### Guidelines

Use this message to capture both aggregation and disaggregation events simultaneously. If the items being disaggregated have a Russia target market, this message initiates the [911 - Unit Pack](#) and [914 - Unit Append](#) reports in addition to the [913 - Unit Extract](#) report.

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 2 hours.

ⓘ When choosing to send multiple aggregation events (aggregations, disaggregations, or a combination thereof) at the same time, use the Aggregation Update message instead of individual Aggregation or Disaggregation messages.

**Message Type:** SOM Aggregate Update

**Info Exchange Display Name:** Aggregate Update

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

❗ The MDLP Bulk API currently has a limit of 20 events per message.

# Aggregation Update (SOAP)

## Aggregation Update Request

### Guidelines

The Aggregation Update message allows Pharmaceutical Manufacturer Owners to report the aggregation and disaggregation of product simultaneously to account for warehouse packing activities. Each message can contain multiple aggregations or disaggregations.

❗ When sending multiple aggregation events (i.e. aggregations, disaggregations, or a combination thereof) at the same time, use this message instead of individual Aggregation or Disaggregation messages.

❗ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

❗ The MDLP Bulk API currently has a limit of 20 events per message.

The following data is sent in the request to TraceLink:

| Elements         |                |                          | Occurs Length | Type | Notes                                                                                       |
|------------------|----------------|--------------------------|---------------|------|---------------------------------------------------------------------------------------------|
| soapenv:Envelope |                |                          | 1...1<br>-    | -    | <b>Required.</b> The SOAP envelope root element.                                            |

|                | Cannot perform operation on serial number [Serial Number] with item state [Serial Number Status]. This operation can only be performed when the serial number is Available or Blocked or Picked. |
|                | Serial Number <Serial> cannot be disaggregated because it was not previously aggregated to <ParentSerial>.                                                                                       |
|                | Event timestamp is earlier than the aggregation date for serial number <Serial>.                                                                                                                 |

Aggregation Update Response

Guidelines

 The MDLP Bulk API currently has a limit of 20 events per message.

The following data is included in the message response:

| Data Element          |  |  |  |  | Occurs Length | Type   | Description                                                                                                                                                              |
|-----------------------|--|--|--|--|---------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| S:Envelope            |  |  |  |  | 1...1<br>-    | -      | <b>Required.</b> The SOAP Envelope root element.                                                                                                                         |

# Take sample

# Take sample APIs

## Why do I use these messages?

Use the following messages to mark product as sampled for quality assurance or inspection by government authorities.

## Which report do these messages generate?

These messages generate the [552 - Withdrawal](#) report in the Russia Compliance application if their contents meet the report conditions.

 TraceLink disaggregates the sampled product if the serial numbers are aggregated to parent containers, which prompts a disaggregation event and initiates the [913 - Unit Extract](#) report.

# Take Product Sample (XML)

## Guidelines

**Message Type:** SOM\_TAKE\_SAMPLE

**Info Exchange Display Name:** Take Product Sample

 When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

## Take Product Sample (SOAP)

### Take Product Sample Request

#### Guidelines

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

The following data is sent in the request to TraceLink:

| Data Element     | Occurs Length | Type | Description                                                                                            |
|------------------|---------------|------|--------------------------------------------------------------------------------------------------------|
| soapenv:Envelope | 1...1<br>-    | -    | <b>Required.</b> SOAP Envelope root element.                                                           |
| soapenv:Header   | 1...1<br>-    | -    | <b>Required.</b> Not used.                                                                             |
| soapenv:Body     | 1...1<br>-    | -    | <b>Required.</b> SOAP Message Body.                                                                    |
| urn:TakeSample   | 1...1<br>-    | -    | <b>Required.</b> Request message that sets a <b>Sampled</b> attribute for all provided serial numbers. |
| SampleRequest    | 0...1<br>-    | -    | <b>Required.</b> SampleRequest request message.                                                        |

## Example

```
<S:Envelope xmlns:S="http://schemas.xmlsoap.org/soap/envelope/">
  <S:Body>
    <ns2:TakeSampleResponse xmlns:ns2="urn:tracelink:soap" xmlns:ns3="http://tracelink.com/som">
      <TLResponse>
        <Success>true</Success>
      </TLResponse>
    </ns2:TakeSampleResponse>
  </S:Body>
</S:Envelope>
```

# Shipment

# Send shipment APIs

## Why do I use these messages?

Use the following messages to create outbound deliveries for items being shipped. A shipment message captures details of the business transaction, including which products are being shipped, where they are being shipped to, and why they are being shipped.

## Which reports do these messages generate?

These messages generate one of the following reports in the Russia Compliance application if their contents meet the report conditions:

- [381 - Move Owner](#) – Captures the transfer of items manufactured by a CMO to the MAH after the items have been part of a product release.
- [331 - Foreign Shipment](#) – Captures information about serialized items that are shipped to Russia for import as a non-consignment direct order.
- [334 - Custom Move](#) – Captures the transfer of serialized items between customs zones as the items are being imported to Russia.
- [431 - Move Place](#) – Captures the transfer of serialized items between warehouses in Russia.
- [415 - Move Order](#) – Captures information about serialized items that are shipped in Russia as a sale to a *registered* buyer (i.e. the **Ship To Location** has a 14-digit Russia Account Number in Partner Master Data) or as a return to a seller.
- [441 - Move Unregistered Order](#) – Captures information about serialized items that are shipped as a sale to an *unregistered* buyer in Russia (i.e. the **Ship to Location** does *not* have a 14-digit Russia Account Number and the **To Business** has a 36-digit Russia Account Number or is identified by a Russia INN or KPP in Partner Master Data).
- [541 - Move Destruction](#) – Captures the transfer of serialized items to a destruction facility in Russia.

## Sales Shipment (XML)

### Guidelines

Use this message when shipping product as a sale (i.e. the shipment is not a transfer or return).

This message allows shipment data to be sent in two parts (i.e. shipment information and serial numbers). For example, shipment information can originate from an ERP system and serial numbers from WMS system or 3PL partner.

- When product changes ownership from an MAH, or a CMO or 3PL acting on behalf of an MAH, to another entity, an outbound shipment is generated and the serial numbers are put into a **shipped** state.
- When product is moving between locations (i.e. not a change of ownership) working on behalf of an MAH, an inbound shipment is generated and the serial numbers are put into a **pending receipt** state.

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 4 hours.

**Message Type:** SOM\_SALES\_SHIPMENT

**Info Exchange Display Name:** Sales Shipment

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

⚠ Elements in the table below that offer lookup functionality through certain identifiers are applicable to *TraceLink Customers only*.

|              |  |  |  | som:Aggregation   |       | 0...*<br>-    | -        | <p>The Aggregation item group is used to communicate new aggregations created by the warehouse that are included in the shipment.</p> <p>The PickedItems will continue to include the top level container serial numbers and/or loose items. If the warehouse created a new aggregation (e.g. created a new pallet, created a new mixed case), the aggregation hierarchies created in the warehouse are communicated in the Aggregation element.</p> <p>If an existing case is shipped, the case just needs to be scanned and the case hierarchy would not be provided. If a new mixed case is created, the hierarchy for the new case will be communicated.</p> <p>This enables the distribution warehouse to locally manage changes to aggregation hierarchies and communicate just the new aggregation hierarchies of the shipped goods at the time of shipment, without having to send disaggregation and aggregation events. The backend will perform the implicit disaggregate and aggregate operations to achieve the end state aggregation hierarchy prior to processing the shipment. It will also auto-commission the SSCC numbers for new cases and pallets when these SSCC numbers are not yet commissioned.</p> |

```

The delivery complete flag is set to true because this is an example where all of the information (order detail and picked serial numbers) are provided in a single message.

If only partial information was provided (e.g. order detail only, picked items sent incrementtally, etc) then the delivery complete flag would be set to false for all intermediate messages,

and then set to true when the delivery is complete. The delivery complete flag instructs TraceLink to process the outbound delivery, update the status of all serial numbers and sub-child

aggregations to shipped, and trigger generation of regulatory reporting messages based on customer configuration.

## Sales Shipment (EPCIS v1.2)

### Guidelines

Use this message when shipping product as a sale (i.e. the shipment is not a transfer or return).

To submit both shipment information and serial numbers in this message, all shipment data must originate from the same system. If shipment information and serial numbers must be submitted separately (e.g. because shipment information is managed in a separate ERP system), use a combination of this

message and the Sales Shipment (XML) message (i.e. submit the Sales Shipment (XML) message containing the shipment information and set the DeliveryComplete flag to "false", and then submit the Sales Shipment (EPCIS v1.2) message containing the bizTransactionID and serial numbers only).

- When product changes ownership from an MAH, or a CMO or 3PL acting on behalf of an MAH, to another entity, an outbound shipment is generated and the serial numbers are put into a **shipped** state.
- When product is moving between locations (i.e. not a change of ownership) working on behalf of an MAH, an inbound shipment is generated and the serial numbers are put into a **pending receipt** state.

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 4 hours.

**Message Type:** SOM\_SALES\_SHIPMENT

**Info Exchange Display Name:** Sales Shipment

ⓘ When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

⚠ NTINs *must* follow the [GS1 Guidance](#) standards as found on the GS1 website.

- Ex: urn:epc:id:sgtin:415001647778.0.100000000022
- Format: urn:epc:id:sgtin:[company prefix].[indicator digit].[item ref].[serial number]

Information regarding NTINs cannot be exchanged with trade partners unless the specific format outlined above is followed. If using an NTIN without following this format, an outbound error occurs when passing data from TraceLink to a trade partner.

# Shipment Event (EPCIS v1.2)

## Guidelines

Use this message for any type of shipment (i.e. sale, transfer, or return) that is sent from a trade partner to the Serialized Operations Manager Owner. This message can contain optional commissioning, aggregation, decommissioning, and destruction data, in addition to the required shipping data.

 When product changes ownership (e.g. an MAH sells product to a distributor), an inbound shipment is generated and the serial numbers are put into a **pending receipt** state.

This message uses the Park and Retry functionality. If a prerequisite condition for this message has not been met, TraceLink stops processing the task, returns the task to the queue, and then tries to process the task again every 15 minutes for up to 2 hours.

### Message Types:

- SOM\_SHIPMENT\_EVENT
- SOM\_SHIPMENT\_EVENT\_IB

### Info Exchange Display Name: Received Shipment Event

 When sending an element in Date or DateTime format, a valid date must be given. "00" is not a valid day or month value and "0000" is not a valid year value.

 NTINs *must* follow the [GS1 Guidance](#) standards as found on the GS1 website.

- Ex: urn:epc:id:sgtin:415001647778.0.100000000022
- Format: urn:epc:id:sgtin:[company prefix].[indicator digit][item ref].[serial number]

Information regarding NTINs cannot be exchanged with trade partners unless the specific format outlined above is followed. If using an NTIN without following this format, an outbound error occurs when passing data from TraceLink to a trade partner.
